

What the parts data still can't tell us

Jensen Production · parts & stock review · 26 August 2026

Every live part was checked against stock, cost, duty and reorder settings. Most of the catalogue is in good shape. Below is what is missing, ordered by what it costs us to leave alone.

Four boxes marked *Decision needed* are the whole ask. Everything else is here for context.

Live parts	172
Stock held with no cost	1 part · 499 units
Parts whose duty default is wrong	159
Parts with a reorder point set	0 of 172

Needs a decision

499 baskets worth nothing on paper

JP-BasJen — Basket for front mount Jensen model.

499 in stock, added on 1 July 2026 with the note “*est 010726*” and no price. Because nothing records what they cost, they are valued at **0 kr.** in stock value, and any bike built with one counts the basket as free.

The supplier offering on file is **5,50 USD**, which would put the batch somewhere near 19 000 kr. — but that is a quote, not what we paid.

Decision needed. What did we pay for these, roughly? An estimate is fine and can be back-dated to July.

93 display cards entered as a test

JP-AND-DSP-NTC — ANANDA 36v Display Canbus NTC card.

93 units on hand, from two stock entries whose reason is literally “*test*” — one dated April 2024, one August 2026. They are counted as real stock today and will be picked for builds.

Decision needed. Are these 93 cards physically on the shelf, or should the entries be reversed?

Import duty on the next order

159 parts will default to no import tax

Import tax is applied only when a part’s **origin** says where it comes from. Right now just **3 of 172** parts have an origin set. The other 159 have an HS code and a tariff rate on file, but no origin — so a new

purchase-order line leaves the duty box unticked by default.

Nothing has been lost so far. 163 past PO lines did carry duty, totalling **98 233,88 kr.** correctly inside landed cost, and 6 lines carried anti-dumping on top. This is about what happens on the *next* order if nobody ticks the box by hand.

Decision needed. Worth an afternoon setting origin (EU / non-EU) across the catalogue?

11 parts have no HS code at all

Without an HS code there is no tariff rate to apply, so these always land duty-free regardless of origin. Sixteen historical PO lines already went through at a zero tariff.

Missing prices

No retail price — cannot be quoted or billed

JP-AND-M100-CS · JP-AND-M100-PWR · JP-BR001 · JP-brc6001f · JP-SLFFH01B

These five have no customer price, so they cannot go on a work order or an invoice line without one being typed in each time.

No supplier on file — cannot be reordered

JP-EDHC60003RNDHSG · JP-BR001 · JP-AHBIM40PDC · JP-ShiRX010

No supplier offering means no price, no MOQ and no lead time — these cannot be added to a purchase order at all. JP-BR001 appears on both lists, and sits in 6 bike recipes.

Six parts with no cost and no stock

JP-AND-M100-CS · JP-AND-M100-PWR · JP-EWHRX010FDAB · JP-EWHRX010RDACB · JP-sh-M405 · JP-SLFFH01B

Nothing to value, so no action needed — they will pick up a cost the first time they are bought. Two of them (JP-SLFFH01B , JP-AND-M100-PWR) are in bike recipes, so those templates currently under-state what a bike costs to produce.

Settings worth a look

No part has a reorder point

None of the 172 parts has an explicit reorder level, so every *low stock* warning in the app falls back to a rule of thumb: **on hand $\leq$ 20% of the last purchase quantity.**

That has one blind spot worth knowing. A part we have never bought through a purchase order has no "last purchase quantity", so it can never show as low. It goes straight from fine to out.

Decision needed. Which parts are worth setting a real reorder level on? The busy 20 would cover most of it.

11 old stock movements without a recorded cost

Historical entries from before costs were required. They are flagged so they can be found, and do not need fixing unless one of them matters.

Fixed today — no action needed

Context so the numbers do not look surprising next time you open the app.

- **51 328,75 kr. of stock restored** — 766 units across 55 parts. Test bikes built in June had consumed real stock; that consumption has been reversed.
- **Sapim 271 spokes** were showing **−207** on hand. Now +9.
- **Test data removed** — 15 test bikes, along with their orders, tickets and work orders.
- **Invoice numbering reset.** Only test invoices had ever been issued, so the first real one will be INV-2026-0001 .
- **Paint SKUs retired** — the four remaining J.Jensen painting items, which belong in the paint price lists rather than the parts catalogue.

Figures read directly from the production database on 26 August 2026, after the cleanup described above. Counts cover live parts only; archived and deleted items are excluded.
