

The app is ready for you to try — August

For Dennis. A guide to the stretch between now and the week of 17 August, when I hope we can sit down together.

Nothing in here is a task list. If the only thing that happens this month is that you open the app a few times and tell me what you think, that is the version of August I am hoping for. Everything else is optional, and none of it is data entry.

If you would rather skip ahead to the interesting part, it is *calls that become tickets* — five minutes, your own phone, and the change I would most like your reaction to.

Two small things first, if you have a moment

1. Put yourself in the system

Admin → People & roles → New person. Your name and email, tick **Owner** under Roles, then “Add person”. That is the whole thing — one form.

Owner sees everything: every screen, every button. That is what you want while you are exploring. The rest of the fields can stay as they are.

This changes nothing about how you log in — it is just the app knowing who you are. Two things start working once you are on the list: **jobs can be assigned to you by name** (open any work order and you will see an assignee), and you become someone the app can notify when something needs attention. Right now I am the only name in there, which is not much use to anyone.

2. Choose your language

Admin → Settings → General. Two settings:

- **App language** — the office side: orders, invoices, customers, admin.
- **Workshop language** — the shop-floor screens the mechanics use.

Set both to whatever suits you. They are independent on purpose: you might want Danish on the floor and English in the office, or the same for both.

It takes effect immediately, and you can change it as often as you like. I have checked every screen in Danish and it is complete — nothing falls back to English. Entirely your call.

The part that would help most

Use the app as though it were already your system, and jot down anything you notice.

Not bug reports — just reactions. The things worth capturing:

- **“This is not how we actually do it.”** The most valuable thing you can tell me. I built from what I understood; you know the real job.
- **“I expected this to be here and it wasn’t.”**
- **“I don’t know what this word means”** or “we call this something else.”
- **“This takes too many clicks.”**
- **“This screen is confusing”** — even if you can’t say why yet.
- **“Can it also do...?”**

A note on your phone or the back of an envelope is plenty. Page name plus one line — I don’t need detail, I need your reaction. Anything you send becomes something we decide together when we meet.

Nothing you click can break anything. Create test parts, fake customers, practice orders, whatever helps. The database is backed up every night. Make a mess if it helps — I would far rather you explored freely and we tidied up afterwards than that you were careful and learned nothing.

Two exceptions, further down.

The one thing I would most like you to try: calls that become tickets

This is the biggest change since you last looked at the app, and it makes far more sense after doing it once than after reading about it.

What it does. Someone rings the workshop number. The app answers, plays a short “this call is recorded” notice in Danish and English, then rings a real mobile. If you pick up, you have an ordinary conversation — and in the background the app records it, transcribes it, works out which customer and which bike it was about, and leaves a **draft ticket** waiting in **Inbox**. If nobody answers within twenty seconds, the caller gets voicemail instead, and that becomes a draft ticket too.

Nothing is ever sent to a customer, and no draft becomes a real ticket without a person clicking. That is what “review only” means, and it stays that way this month regardless of what you do below.

Right now the phone that rings is my test mobile. **It would be far more useful if it rang yours** — then the whole thing is being tested on your voice, your customers’ names and your Danish, which is the one part I cannot test on my own.

Trying it end to end — about five minutes

You need two phones: the one that should ring, and any other phone to call from.

1. Admin → Settings → Calls & inbound.

- 2.** Under **When someone calls** it should already say *Ring a phone, then voicemail*. Leave that as it is.
- 3.** In **Phone to ring**, replace my number with your own mobile, written in international form — **+45** followed by your number, no spaces. Save.
- 4.** From the *other* phone, call **+1 762 500 0850**. It is an American test number, so your phone will treat it as an international call — a few kroner. Your real Danish number takes its place before go-live.
- 5.** You will hear the recorded-call notice, and then your mobile rings. Answer it.
- 6.** Talk for thirty seconds or so, the way a customer would: a name, a bike, something wrong with it. In Danish, ideally.
- 7.** Hang up both ends.
- 8.** Give it a minute, then open **Work → Inbox**. Your call should be sitting there — the recording, the transcript, and what the app made of it.

What is worth looking at when it lands. Did it get the words right? Did it work out who was calling? Did it find the bike? Did it understand what the customer actually wanted? Anything it got wrong is worth a line in your notes; that is precisely the feedback that improves it.

One thing worth knowing in advance: every Danish test so far has been a voicemail, and voicemail audio is poor. A two-way call is much cleaner, so I expect better — but a bridged Danish call is honestly the one test I have not been able to run. If the transcript comes back as nonsense, you have found something real rather than broken something.

When you want your phone out of it again, put my number (+45 50 36 71 11) back in the same field, or set **When someone calls** to *Take a voicemail*. Nothing else is affected either way.

To be clear, none of this is one of the two switches further down — changing which phone rings is reversible in a second, and review-only mode stays on throughout.

A suggested hour, if you'd like a route

No obligation — but this order touches most of the app and follows roughly how a real week runs.

1. **Dashboard.** What needs you today. Money at the top, then your pipelines. If a card is not there, nothing needs you.
 2. **A bike.** Bikes → pick one → read its page. History, parts, photos, its QR code, who owns it.
 3. **The workshop floor, on your phone. Work → Workshop floor** on your actual phone, not the computer. That is how your mechanics will meet this app, and it is built for gloves and bad light. **Scan** is worth a try too.
 4. **A repair, start to finish.** Work → Tickets → New ticket against a real bike. Then “Start work order”, add a couple of parts, mark it done. The ticket closes itself and the job appears as ready to invoice.
 5. **A build.** Orders → Manufacturing → pick an order → open a bike → Build. This is where a bike gets assembled: confirm the frame number, pull in the recipe, finish the build. Stock comes off automatically.
 6. **Print something.** A purchase order, a picking list, a sheet of QR stickers. These are the paper your shop actually runs on — they should look right coming off the printer.
 7. **Your customers on a map.** Customers → Map. Where your bikes are, whose agreements are running out.
-

Where your eye is worth more than mine

If you have appetite beyond exploring, these are the places where only you can tell whether the app is right. All four are *checking*, not typing.

- **The bike recipes.** Bikes → Bike templates → open one. Is that genuinely what goes into that bike, in those quantities? These lists drive costing, purchasing and picking, so an error here spreads everywhere.
 - **Your painter's prices.** Admin → Services. Your real price lists, including the quantity breaks. Do the numbers match what Metacoat actually charges?
 - **Part names and categories.** Parts → All parts. Anything named confusingly, filed in the wrong category, or duplicated?
 - **Stock figures will look wrong, and that is expected.** Opening stock was never entered, so some parts show odd or negative numbers — you will see one part sitting at minus 207. That is not a fault; the app only knows what it has watched come in and go out. One physical count on the morning we go live fixes it, not typing.
-

What is new since you last used it

In plain terms:

- **The whole app speaks Danish**, and now so does every last screen.

- **It looks like Jensen** rather than a generic admin tool. Six colours with fixed meanings — blue for navigation and main actions, sand/gold for money and “worth a look”, green for ready and on schedule, red only for something genuinely wrong, rust for buying and suppliers, purple for settings and agreements. Red is deliberately rare, so if you see it, it means you.
- **The left menu is seven groups instead of a long list**, grouped the way you talk about the job. Open a group and it stays how you left it.
- **All the drop-down lists live on one page:** Admin → Lists. Categories, colours, coatings, customer segments, bike families, HS codes, stock locations, paint part types — tabs down the side. Old bookmarks still work; they just bring you here.
- **Phone calls become tickets** — recorded, transcribed, matched to a customer and left as a draft in **Inbox**. The section above is the one worth five minutes of your own phone.
- **Paint became a general “services” model** with your price lists and quantity breaks, so washing or priming can join later without rebuilding.
- **People & roles** — each role can eventually get its own login showing only their part of the app. Built, not switched on. Something to do with the team once you have seen it.
- **The dashboard got the money band and trend charts.**

Nothing moved address. Every bookmark you have still lands where it did.

I also spent a full day testing the app end to end — every screen, and every job from creating a bike through to invoicing — and fixed what it turned up. There is nothing outstanding that I know of. Which is exactly why your fresh eyes are worth more than more of mine.

This release is version 0.11.0. Worth mentioning if you send me something, so I know exactly what you were looking at — I will keep changing things while you are trying it, and it saves us both guessing.

Two things I would leave until we are in a room together

Everything else is fair game.

1. **Issuing an invoice.** Drafts are completely safe — make as many as you like, and the print preview shows exactly what a customer would receive. But pressing “Issue” permanently takes a number out of the official sequence, and that sequence has to be clean and gapless for your revisor. So: draft freely, and I would save the Issue button for the first real one, with both of us looking at it.
 2. **The three switches.** Supplier email is in test mode, the phone pipeline is in review-only mode, and e-conomic is still pointed at a practice account. All three are one click from being real, and each one sends something outward that cannot be pulled back. They are better flipped with both of us watching, and mid-August is soon enough.
-

If something looks off

1. Screenshot the page, including the address bar.
2. Note what you clicked just before.
3. Send both to me at nazar@valent.dk, with the bike or order number if there is one.

That is the ideal version — a one-line message with no screenshot is also completely fine. Worst case we restore last night's backup. You cannot destroy anything.

Your own copy, on your own hardware

Something I would like to propose rather than leave for you to ask about.

The idea is simple: once a month, a complete copy of the system — the database, the photos, the call recordings, the code and the documentation — lands as a single encrypted file on a server of yours. The password lives in your own password manager, never next to the file itself. Not because I expect anything to go wrong, but because a business should not sit on one person's laptop, and that includes mine.

The part worth sitting down over is the difference between *having* a copy and being able to *use* one. Rather than assure you it works, I would suggest we spend half an hour doing it for real on your machine: unpack an archive, load the database into a fresh test project, open the app against it. Then you have seen it work rather than taken my word for it. That is a natural fit for the day at my place, below.

The one part I cannot decide on my own is where the copy should live. Is there a server or NAS at the workshop that would suit, and who looks after it? If there isn't one, that is no obstacle — there are other routes, and it is a small purchase rather than a project. Either way it is worth five minutes of your thinking before I build the routine around the wrong assumption.

Two sessions I would suggest — week of 17 August

If you have written anything down, that is the agenda. I would far rather spend the time on what you noticed than on my plans.

One at your place, half a day. It should be there because the questions are physical: where the bikes actually are, what is on the whiteboard, how a job sheet moves across the bench, whether the kit stickers match what is on the shelves. It is also the only setting where I can watch you do one real job the way you do it today — watching rather than coaching, because everything the app gets wrong tends to show up in that half hour.

One at mine, half a day. It should be here because the workshop interrupts every ten minutes, and the invoicing work needs two screens and no interruptions: a real Jensen invoice beside what the app produces, line by line, until they match. Your revisor on the phone for the handful of questions only they can answer. The restore rehearsal above. And whichever of your notes turn into actual changes.

Also worth putting on the table that week: a go-live date — I would suggest Monday 31 August, since a month end is cleanest for the bookkeeping, but that is a date you set rather than me — along with who on your team sees what, and getting your real customers and bikes in.

Whether that is the right week, and which days suit, is entirely yours to say.
