

What I need from you — your bikes, your agreements, and Finn's phone

For Dennis, 24 September 2026. Two things we want to start soon: repair orders on the bikes already out with your customers, and recording Finn's repair calls. Both are waiting on information only you have. This page says exactly what, and why.

1 • The bikes already out with your customers

Why it matters now. A repair order has to be attached to a real bike, and the system only knows about the bikes built inside it. Your customers are already in — 533 of them, with their e-conomic numbers — but the bikes they own are not. This is the one piece of old data we genuinely need before repair work can start.

What I need: one list, one row per bike. I am sending you a spreadsheet for it (*FLEET-LIST-DENNIS-2026-09.xlsx*, explained on the second sheet). Only **two things are required per bike**:

REQUIRED	WHY
Which customer it belongs to	a repair is billed to — or covered for — the owner
The frame number (<i>stelnummer</i>)	it is how we tell one bike from another, for ever

Everything else — the customer's own fleet number, model, colour, lock and battery numbers — is welcome but optional. **A blank is fine; a guess is not.** And if a bike's frame number is simply unknown, still put the bike on the list: we confirm the number the first time Finn has it in his hands.

Already have it written down somewhere? Don't retype it. Customer Excel sheets, delivery notes, e-economic invoice exports — send them as they are and I will do the sorting. The spreadsheet is for what lives only on paper or in your head.

2 • The service agreements

Scan them. A phone scanner app is fine. One PDF per agreement, named after the customer. It does not matter that the old ones are in different formats: I read each one into the system and send you a short summary to check. That check matters, because *covered or not covered* decides whether a repair is invoiced.

Only the agreements that are still running, plus any expired one for a customer who still has your bikes and might renew.

From each one the system needs:

- who it is with, and for which site if not all of them
- when it started, when it ends, and how it renews or is cancelled
- what the customer pays, and how often
- **what is covered** — parts, labour, or both — **and what is not** (tyres? vandalism? batteries?)
- how many service visits a year, and whether GPS is part of it

One question I need a straight answer to: *does any agreement cover only some of a customer's bikes* — say 20 of their 35? Today the system treats an agreement as covering every bike that customer (or that site) owns. If you have agreements that don't work that way, I need to know before we load anything, not after.

3 • Finn's repair line

What we want: a customer rings your number, hears your menu, presses 2 for service, and reaches Finn — with the call recorded, written out, and matched to the customer automatically so it becomes a repair ticket without anyone typing it up.

The part of this that already works. It was tested on a real call in July: the caller hears a short notice that the call is recorded, Finn's phone rings, they talk normally, and within half a minute of hanging up the conversation is in the system — written out, with *customer said* and *workshop said* kept apart, and the customer found by their phone number. If Finn doesn't answer, the caller leaves a voicemail instead, which lands in the same place.

What is missing is connecting your number to it. There is one rule that decides how: *to record a call that is answered, the call must pass through our system while it happens*. Three ways to do that:

A • Send only "press 2" to us — *what I recommend*. You keep your number, your phone company and your menu exactly as they are. We ask your phone company to send option 2 to a new Danish number of ours instead of straight to Finn. From there we play the notice, ring Finn and record. Only repair calls are touched, nothing is moved, and it can be switched back in minutes.

B • Move your whole number to us and rebuild the menu inside the system. More control in the end — every line could be recorded and routed — but moving a Danish number takes weeks of paperwork and just as long to undo, and it would make us your entire phone system, sales and office included. Worth considering later, not as the first step.

C • Use your phone company's own call recording, if your subscription has it, and collect the recordings from them. Nothing about the calls changes — but whether it is possible depends entirely on which product you have. I would only look at this if A turns out to be impossible.

What I need from you to go ahead with A:

1. **Which phone company and which switchboard product** runs your menu today? The name on the bill is enough.
2. **Can option 2 be pointed at an outside number?** Your phone company can answer this in one call.
3. **When a call is passed on, does the caller's own number come with it** — or does it arrive showing your company number? The system finds the customer by their number, so this matters more than it sounds.
4. **Does Finn answer on a mobile, a desk phone or an app?** And what should happen out of hours — voicemail?
5. **Is Finn happy to have his calls recorded?** The caller is told at the start of every call; Finn should also be told in writing, which is his employer's job, not the system's.
6. **Should Finn's own calls *out* to customers be recorded too?** That is not covered by any of the above and would be a later step.

What it costs. A Danish number is about 15 kr. a month. Calls are charged per minute twice — once coming in to us and once going on to Finn's mobile — plus a small per-minute charge for writing the call out. For a repair line alone this should come in under the 230–350 kr. a month I estimated earlier for all your calls; one real month will turn that into a firm number.

In short, the three things to send me: the bike list (or whatever you already have), the agreement scans, and the answers to the six phone questions above.
